

Many To One Relationship

- **1:N and N:1 are the same relationship** — just **perspective changes**:
 - 1:N → “one parent has many children”
 - N:1 → “many children belong to one parent”
- **Reference placement rule:** Always store reference on the **many side**, regardless of which way you describe it.
- **1:N (One-to-Many)** and **N:1 (Many-to-One)** are **the same relationship** in the database.
- The only difference is **how you look at it**:

Perspective	Description
1:N	“One parent has many children” → e.g., Customer → Orders
N:1	“Many children belong to one parent” → e.g., Orders → Customer

- **Database implementation** doesn't change:
 - The reference is always stored on the **“many” side** (child side).
- **Querying changes** depending on which way you want to view the data:
 - 1:N → “Get all children of a parent”
 - N:1 → “Get the parent of a child”
